

Employee Asset Register Module Review Report

Module Reviewed: `md_employee_asset_register.zip` **Target Version:** Odoo 18.0 **Review Date:** 03 July 2026
Review Type: Static code review against TRD + syntax checks

Review Summary

The module partially satisfies the TRD. Core models, fields, menus, views, sequence data, category data, and basic workflow methods are present. However, the delivery is not ready for acceptance because several required deliverables are missing, the shared zip contains generated/local artifacts, and some logic does not fully match the TRD.

Full install/functional testing in an Odoo database was not executed in this workspace because no Odoo 18 server/configuration is available here. Static Python compilation and XML parsing were executed successfully.

Test Results

Test	Result	Notes
Python syntax compile	Pass	All <code>.py</code> files compile successfully.
XML well-formed parsing	Pass	All XML files parse successfully.
Manifest presence	Pass	Manifest exists and has required base metadata.
Required README	Fail	README.md is missing.
Required i18n files	Fail	i18n/de_CH.po, i18n/fr_CH.po, and i18n/it_IT.po are missing.
Required static description files	Fail	static/description/icon.png and static/description/index.html are missing.
Zip hygiene	Fail	Zip contains <code>__MACOSX</code> and <code>__pycache__</code> artifacts.
Odoo install test	Not Run	Requires Odoo 18 runtime/database.

Must Fix Before Acceptance

1. Missing Required Deliverables

Severity: High **TRD Requirement:** Module must include `README.md`, required `i18n` files, and static app description files.

Current Issue:

- `README.md` is not present.
- `i18n/` directory exists but contains no `.po` files.
- `static/description/` directory exists but contains no `icon.png` or `index.html`.
- Manifest image entry is commented out in `__manifest__.py`.

Evidence:

- `__manifest__.py`, line 28:

```
# "images": ["static/description/icon.png"],
```

Expected Fix:

- Add `README.md`.
- Add:

- i18n/de_CH.po
- i18n/fr_CH.po
- i18n/it_IT.po
- Add:
- static/description/icon.png
- static/description/index.html
- Uncomment/add manifest images:

```
"images": ["static/description/icon.png"],
```

2. Shared Zip Contains Generated and Local System Files

Severity: High **TRD Requirement:** Do not share/commit generated cache files or local artifacts.

Current Issue:

The zip contains:

- __MACOSX/
- md_employee_asset_register/__pycache__/
- md_employee_asset_register/models/__pycache__/
- Multiple .pyc files

Expected Fix:

Regenerate the module zip after removing:

```
__MACOSX/
__pycache__/
*.pyc
```

3. Validation Messages Are Not Translation Ready

Severity: High **TRD Requirement:** All user-facing validation messages must use `_()`.

Current Issue:

models/md_employee_asset.py imports only:

```
from odoo import api, fields, models
```

Validation errors use plain strings, not `_()`.

Evidence:

- models/md_employee_asset.py, lines 177-194.

Expected Fix:

Import `_` and wrap messages:

```
from odoo import _, api, fields, models

raise ValidationError(
    _("Assigned Employee is required when Status is Assigned.")
)
```

Apply the same for all validation messages and SQL constraint messages where applicable.

4. Asset Code Field Is Not Marked Required

Severity: Medium **TRD Requirement:** Asset Code is mandatory and unique, auto-generated if not entered.

Current Issue:

md_asset_code is unique and auto-generated in `create()`, but the field itself is not marked `required=True`.

Evidence:

- models/md_employee_asset.py, lines 20-24.

Expected Fix:

Set:

```
md_asset_code = fields.Char(  
    string="Asset Code",  
    required=True,  
    copy=False,  
    tracking=True,  
)
```

Keep the `create()` sequence logic so manual entry remains optional in the UI only if the developer intentionally handles draft values before save. If Odoo blocks empty required fields before `create()`, use a default value of `/`.

5. Mark Assigned Button Does Not Explicitly Validate Employee First

Severity: Medium **TRD Requirement:** `action_mark_assigned()` must validate that employee is selected, then set status and assigned date.

Current Issue:

The method sets `state = "assigned"` first and relies on model constraints to raise an error afterward if no employee is selected.

Evidence:

- `models/md_employee_asset.py`, lines 131-135.

Expected Fix:

Validate first:

```
def action_mark_assigned(self):  
    for record in self:  
        if not record.md_employee_id:  
            raise ValidationError(  
                _("Assigned Employee is required when Status is Assigned.")  
            )  
        record.state = "assigned"  
        if not record.md_assigned_date:  
            record.md_assigned_date = fields.Date.context_today(record)
```

6. Security Group Does Not Match TRD Label/Scope Exactly

Severity: Medium **TRD Requirement:** Create one group named `Employee Asset Manager` with XML ID `md_group_employee_asset_manager`.

Current Issue:

The module creates two groups:

- `md_group_employee_asset_user` with label `User`
- `md_group_employee_asset_manager` with label `Manager`

Evidence:

- `security/md_employee_asset_register_groups.xml`, lines 10-19.

Expected Fix:

Use one group unless a second role is explicitly approved:

```
<record id="md_group_employee_asset_manager" model="res.groups">  
    <field name="name">Employee Asset Manager</field>  
    ...  
</record>
```

Remove the extra user group if not required.

7. Asset Action Includes `search in view_mode`

Severity: Medium **TRD Requirement:** Asset list, form, kanban, and search views must be available. Search views are linked automatically by model/action; `search` is not normally included in `view_mode`.

Current Issue:

view_mode is:

```
list, form, kanban, search
```

Evidence:

- views/menus.xml, line 7.

Expected Fix:

Use:

```
<field name="view_mode">list, form, kanban</field>
```

Keep the search view record in views/md_employee_asset_views.xml.

Should Fix

8. Manifest Contains Commented-Out Code

Severity: Low **Current Issue:** Manifest has a commented-out images entry.

Evidence:

- __manifest__.py, line 28.

Expected Fix: Remove commented-out manifest code and add the real images entry once the icon exists.

9. SQL Constraint Formatting Is Hard to Read

Severity: Low **Current Issue:** _sql_constraints is written on one compressed line.

Evidence:

- models/md_employee_asset.py, lines 111-112.

Expected Fix:

Format as:

```
_sql_constraints = [
    (
        "md_employee_asset_code_unique",
        "unique(md_asset_code)",
        _("Asset Code must be unique."),
    ),
]
```

10. Computed Asset Count May Be Inefficient on Large Employee Lists

Severity: Low **Current Issue:** md_asset_count filters employee.md_asset_ids in Python. This is acceptable for small datasets but can be inefficient when opening many employees.

Evidence:

- models/hr_employee.py, lines 16-24.

Suggested Fix:

Use read_group() if this count is shown in list views, smart buttons, or any screen with many employees.

Requirement Coverage

Requirement Area	Status	Notes
Module technical name	Pass	Folder and manifest use md_employee_asset_register.
Core asset model	Partial	Model exists; md_asset_code should be required.
Category model	Pass	Model and default categories exist.
Employee extension	Pass	One2many and assigned count exist.

Requirement Area	Status	Notes
Sequence	Pass	Sequence exists and is used in create().
Status and condition workflow	Partial	Core methods exist; assigned action should validate first.
Constraints	Partial	Validation exists but messages are not translatable.
Views	Partial	Views exist; action view_mode should be corrected.
Menus	Pass	Menus are restricted to manager group.
Security	Partial	Access exists, but group design/name differs from TRD.
Chatter tracking	Pass	Required tracked fields are configured.
Translation readiness	Fail	Required .po files missing and validation strings not wrapped in _().
Static app description	Fail	Required files missing.
README	Fail	Missing.
Repository/package hygiene	Fail	Generated/local artifacts included in zip.

Recommended Developer Test Plan

After fixing the issues above, test in Odoo 18:

1. Install the module on a clean database.
2. Upgrade the module without errors.
3. Confirm only Employee Asset Manager users can see the Asset Register menus.
4. Create an asset without entering Asset Code and confirm sequence generates

AST-00001.

5. Try creating a duplicate Asset Code and confirm the unique constraint error.
6. Try marking an asset Assigned without an employee and confirm the validation

message.

7. Assign an employee and confirm Assigned Date is auto-filled.
8. Mark Returned and confirm Return Date is auto-filled.
9. Enter Return Date earlier than Assigned Date and confirm validation error.
10. Mark Damaged and confirm Condition changes to Damaged.
11. Open an employee and confirm the Assigned Assets tab shows linked assets.
12. Confirm Asset Count includes only assigned assets.
13. Confirm chatter tracks changes to the required fields.
14. Confirm filters and group-by options work in the asset search view.
15. Export translations and update the required .po files if needed.

Final Review Decision

Status: Not accepted yet.

The developer should fix the high and medium issues, regenerate a clean module zip, and then run a clean Odoo 18 install/upgrade/functional test pass.
